1. Introducing the Organization

StageOne is a new, independently operated music discovery platform being built as a WEB 268 capstone project at Harrisburg Area Community College. Although StageOne is not an incorporated entity (it is a fictitious organization used for the purposes of the capstone) it is modeled on a real need in the Central Pennsylvania music scene and is designed so it could graduate into a live community-run platform after the course concludes.

1.1 Brief history

The concept for StageOne emerged in early 2026 from conversations with music students in State College who felt that existing streaming platforms (Spotify, Apple Music, etc.) are tuned for established artists, while existing social platforms (Instagram, TikTok) are tuned for viral content rather than local discovery. StageOne is meant to occupy the middle ground: a single, cleanly designed place where a listener can find local artists, hear their tracks, follow them, and know when and where they're playing next.

1.2 Size

At the time of this specification, the organization consists of one developer (Eva Quinn Cihak) operating under the academic supervision of one faculty sponsor (Eric Yoxheimer). There are no employees and no revenue. The development effort for the v1.0 launch is budgeted at 372 developer-hours over 15 weeks (see **Release Plan**).

1.3 Key services

StageOne's primary service is a zero-cost public profile for local indie musicians. Each profile bundles together the elements that currently live scattered across 3–4 separate platforms:

- A textual artist bio and press kit with a profile photo.
- A playable set of tracks (with previews or full streams, depending on the artist's preference).
- A list of upcoming gigs with date, time, venue, and ticket link.
- A 'follow' feature that lets fans receive emails when an artist posts a new track or a new gig.
- An AI assistant that helps listeners discover music by mood, genre, or location.

1.4 Major achievements (planned)

Because StageOne has no operational history yet, the major achievements section below records the milestones the team is targeting rather than achievements already won.

- Launch the v1.0 production release on Apr 30, 2026, with at least 10 seeded local artists.
- Score ≥ 90 on Lighthouse Mobile across all categories at launch.

- Achieve WCAG 2.1 AA conformance across all public pages.
- Receive a passing grade for the WEB 268 capstone showcase and live demo.

2. Objectives

StageOne needs a website because the service simply does not exist in any other form. There is no legacy site to replace and no existing sign-up flow to consolidate — the website is the product. The objectives below are framed as the measurable outcomes the site should help the organization achieve by the end of the three-month post-launch window (August, 2026).

2.1 Primary objective

Enable artist onboarding. Make it possible for an indie musician to go from 'never heard of StageOne' to 'has a live public profile with one track and one upcoming gig' in under 15 minutes. *Measured by: time-to-first-gig-published ≤ 15 minutes for 80% of seeded artists.*

2.2 Secondary objectives

Enable fan discovery. A first-time visitor with no account should be able to land on the home page and, within 60 seconds, be playing a track from a local artist they had not previously heard of. *Measured by: median time-to-first-play ≤ 60 s; drop-off rate to any artist page $\leq 60\%$.*

Grow repeat engagement. A returning fan should be able to check for new gigs and new tracks in under 30s. *Measured by: repeat visit rate $\geq 25\%$ within the first 30 days after launch.*

Demonstrate technical competence. Serve as a portfolio artifact for the developer that clearly demonstrates mastery of the MERN stack, authentication, authorization, multimedia handling, and AI integration. *Measured by: capstone rubric score and instructor sign-off.*

Satisfy the WEB 268 rubric. Include at least four database tables with 10+ fields each, CRUD, multimedia, and an AI feature (bonus). *Measured by: satisfying WEB 268 project requirements.*

2.3 Success thresholds at T+90 days

- ✓ ≥ 10 artist profiles seeded and live (seeded by the developer at launch).
- ✓ ≥ 25 tracks and ≥ 15 gigs published.
- ✓ ≥ 100 unique visitors to the home page.
- ✓ ≥ 20 registered fan accounts.
- ✓ Zero unresolved P0 or P1 incidents.

3. Key Audiences

StageOne serves 3–4 distinct audiences, each with different motivations and different actions they need to take on the site. The table below summarizes the primary goal, the key conversion action, and the relative priority of each audience during the v1.0 launch period.

Audience	Priority	Their goal on the site	Our desired conversion action
Indie musicians (artists)	1 (highest)	Publish a visible profile with tracks and gigs.	Register as an artist, complete profile, upload at least one track and one gig.
Local fans, listeners	2	Find music and gigs they care about nearby.	Register as a fan, follow at least one artist, receive email confirmation.
Press, bloggers, venue bookers	3	Find and contact emerging artists quickly.	Use the artist-page press kit (bio, photo, top tracks) and the Contact link.
Faculty, capstone reviewer	4	Evaluate the capstone against the rubric.	Visit the 'About page', the admin dashboard on staging, and the handover packet.

3.1 What artists want vs. what we want them to do

Artists come to StageOne wanting the lowest-friction possible way to put their music somewhere people can find it. They explicitly do not want to build a website. We want them to (a) register, (b) complete a profile that's detailed enough to be useful to fans and press, and (c) come back to publish new tracks and new gigs on a regular basis. The tension between those two lists is real — a longer profile form yields better results for fans but risks higher artist drop-off — and the design work in Phases 1 and 2 will balance it.

3.2 What fans want vs. what we want them to do

Fans come to StageOne wanting to hear something new they like, ideally from someone local they could see play in person. They don't especially want to register or sign up for emails. We want them to register so we can enable follows and email notifications, because those are the mechanisms that create repeat visits. The design response is to make everything on the public site viewable anonymously, but gate the follow-and-notify behaviors behind a one-field signup (just email + password).

3.3 What press/bookers want vs. what we want them to do

Press and bookers come to StageOne with a very specific task — finding an artist that fits a need. They want a press kit and contact link. We want them to link back to the StageOne artist page when they run a story or book the artist, because inbound links drive SEO and brand

visibility. The design response is a shareable artist-page URL and an artist-page 'press kit' section with ready-to-use high-resolution photos and a short bio paragraph.

4. Provisional Site Structure

The provisional site structure below is deliberately simple: one public header with five primary sections, one gated Account area, and one role-gated Admin area. This structure will almost certainly evolve during the design and build phases, but it captures the current best thinking about StageOne's information architecture.

Figure 1 — Provisional site map for StageOne.

4.1 Primary navigation

- **Home** — The anchor page. A hero promoting featured content, a strip of 'new this week' tracks, a horizontally scrolling 'near you' section, and an always-visible CTA to register or log in.
- **Discover** — The fan's primary exploration page. Genre filters, sort controls (newest / most-followed), and the same AI assistant entry point as Search.

- **Artists** — The artist directory: a grid of artist cards with photo, name, city, and genre chips. Clicking a card opens an artist's profile.
- **Gigs** — All upcoming gigs grouped by date, filterable by city and by genre. Past gigs are archived but not deleted.
- **Search** — Full-text search across artists, tracks, and gigs. Results grouped by type. Includes the AI-assistant conversational search mode as a tab.
- **Account** — Sign In, Sign Up, password reset. After login, routes to My Dashboard (Fan) or Artist Dashboard (Artist).

4.2 Secondary, role-gated branches

- **Artist Dashboard** — Visible only to users with the Artist role. Contains My Profile, My Tracks, My Gigs, and Messages.
- **Admin** — Visible only to users with the Admin role. Contains moderation queues for artist submissions and flagged content.

4.3 Footer utility navigation

- About StageOne: mission, team, capstone context
- Contact: general contact form
- Privacy policy
- Terms of service
- Accessibility statement

5. Technical Specifications

StageOne is more advanced than a brochure site and more opinionated than an e-commerce template. The majority of pages are dynamic: they read from and write to a database, and the AI assistant introduces a non-standard interaction pattern. For that reason this section uses user-story format to specify what each type of visitor should be able to do on the site.

5.1 User stories

5.1.1 Fan (*public, authenticated*)

As a first-time visitor...

- *I want to browse the home page without creating an account so that I can evaluate whether StageOne has anything for me before I give up personal information.*

As a fan...

- *I want to register with just an email and password so that the sign-up step doesn't feel like a chore.*
- *I want to follow an artist so that I get notified the next time they release a track or announce a gig.*
- *I want to play a 30-second preview of a track directly in the browser so that I can decide whether I like an artist without leaving StageOne.*
- *I want to filter the Gigs page by city and by date range so I only see shows I can actually attend.*
- *I want to ask the AI assistant an open-ended question like 'what's a good indie-folk show this Friday?' so that I don't have to figure out the right search filters to get useful answers.*

5.1.2 Artist (authenticated)

As a musician...

- *I want to sign up with a dedicated 'Artist' account type*

So that my role-specific features are unlocked from the moment I log in.

As an artist...

- *I want to edit my bio, profile photo, genre tags, and home city on a single page so that I can keep my profile current without navigating through tabs.*
- *I want to upload a track with cover art, genre, and an optional lyric sheet so that fans see a polished release rather than a bare audio file.*
- *I want to publish a gig with date, time, venue, city, and optional ticket URL so that my followers find out about the show.*
- *I want to see how many followers I have and how many times my tracks have been played so that I can measure whether StageOne is helping me grow.*
- *I want to mark a gig as 'cancelled' rather than deleting it so that followers who saved the date know the plan changed.*
- *I want to send and receive messages with booking contacts so that initial outreach can happen inside StageOne.*

5.1.3 Admin (role-gated)

As an admin...

- *I want to review a queue of artist submissions before they go public so that I can keep spam and duplicate profiles off the site.*
- *I want to be able to suspend a user account for repeat abuse so that StageOne remains safe for fans and artists.*
- *I want to see basic platform metrics (total artists, tracks, follows, AI-assistant queries) on a dashboard so that I can report platform health to the client.*

5.2 Technical preferences

StageOne will use a specific, opinionated stack chosen to match the WEB 268 MERN curriculum and to keep year-one hosting costs near zero.

Layer	Choice	Rationale
Database	MongoDB Atlas (M0 cluster)	Matches the 'M' in MERN; flexible schema fits StageOne's heterogenous content (track, gig, message); free tier is production-adequate for capstone traffic.
API	Node.js + Express (on Render)	Matches the 'E' and 'N' in MERN; Render provides zero-config Git-triggered deploys on the free tier.
Frontend	React + TypeScript + Vite (on Vercel)	Matches the 'R' in MERN; TypeScript catches regressions during a one-developer build; Vercel provides CDN and PR previews on the hobby tier.
Media	Cloudinary	Offloads image/audio uploads, thumbnail generation, and CDN delivery in one SaaS with a generous free tier.
Auth	Custom JWT + bcrypt	Intentionally custom to demonstrate authentication depth for the capstone rubric; no third-party identity provider in v1.0.
AI	OpenAI function-calling, Ollama/Llama-3 fallback	Pairs a high-quality cloud model with a local fallback so the AI feature never goes dark during grading.
Email	Resend	Transactional email with a clean SDK; free tier is enough for capstone volume.

5.3 Integrations with other systems

StageOne does not currently integrate with Spotify, Apple Music, Songkick, or any ticketing provider in v1.0. These are logged as v1.1+ candidates. The only third-party integration surfaces in v1.0 are the hosting platforms themselves (Atlas, Render, Vercel, Cloudinary, Resend, Sentry, UptimeRobot) and the OpenAI API.

5.4 Wireframes

Four low-fidelity wireframes illustrate the primary page types. These are intentionally rough; the color comps in Appendix C show how the visual language fills out once applied.

Figure 5 — Artist dashboard wireframe.

6. Non-Functional Requirements

6.1 Usability and accessibility

- **WCAG 2.1 AA conformance** — All public pages must meet WCAG 2.1 AA. Axe-core runs in CI on every pull request; zero critical/serious issues are permitted to merge.
- **Color contrast** — Text on any background passes 4.5:1 (normal) or 3:1 (large); verified with the color-token contrast matrix in Appendix C.
- **Keyboard operability** — All interactive controls must be reachable by Tab with a visible :focus-visible outline; a skip-to-content link appears first in tab order.
- **Screen reader** — Landmarks, headings, and ARIA attributes reviewed manually with VoiceOver on macOS during Phase 4 (week 12).
- **Responsive design** — Mobile-first breakpoints at 480 px, 768 px, and 1200 px; smallest supported viewport is 360 px.
- **Touch targets** — Minimum 44×44 CSS px for primary touch controls.

6.2 Security

- **Transport** — HTTPS everywhere; HSTS with preload enabled.
- **Secrets** — No secret lives in the repo; environment variables live in Render and Vercel; secrets rotated at launch and every 90 days thereafter.
- **Passwords** — bcrypt hashing with cost factor 12; minimum 10 characters; zxcvbn score ≥ 3 enforced client-side and server-side.
- **Input validation** — Zod schemas on every POST/PUT/PATCH endpoint; HTML stripped from user-generated text before persistence.
- **Rate limiting** — express-rate-limit on /api/auth/* (20 req/min/IP) and /api/ai/* (10 req/min/user).
- **Authorization** — Role-based middleware checks on every mutating endpoint; ownership checks on every artist-scoped resource.
- **Logging** — All auth events and admin actions logged to the backend audit log; source-mapped errors routed to Sentry.

6.3 Performance

- **Lighthouse Mobile** — Performance, Accessibility, Best Practices, and SEO all ≥ 90 at launch.
- **Time to first byte** — TTFB ≤ 800 ms on the Render Starter tier (acceptable ~ 1.5 s on free tier during cold start).
- **Largest Contentful Paint** — LCP ≤ 2.5 s on 4G simulation.

- **Bundle** — React bundle gzipped $\leq$ 200 KB after code-splitting.
- **Media** — Cloudinary auto-format and auto-quality; cover images served as AVIF/WebP with a JPEG fallback.

6.4 Legal and compliance

- **Privacy** — A plain-language privacy policy discloses the data collected and the third-party processors. US-jurisdiction; no cross-border data commitments.
- **Terms of service** — Users accept at account creation; viewable via footer link.
- **Copyright** — Artist upload flow requires an affirmation that the uploader owns or has license to the work. DMCA-style takedown email address published in the footer.
- **Cookies** — Session cookie is *httpOnly* + *SameSite = Lax*. Analytics cookie w/ consent banner.
- **Academic context** — Because the site is an academic deliverable, small disclosures are present throughout the site.

6.5 Reliability and monitoring

- **Uptime target** — 99.5% monthly. Rendered as a rolling 30-day percentage on the UptimeRobot public status page.
- **Backups** — Nightly Atlas snapshots with 7-day retention.
- **Error budget** — The release plan allocates 15 warranty hours across the 90-day post-launch window for Sev 2+ fixes.

7. Websites We Like and Don't Like

The reference sites below informed StageOne's design language. Each entry explains what the team found inspiring or cautionary.

7.1 Sites we like

- **Bandcamp** (bandcamp.com) — The gold standard for artist-first music platforms. We admire the direct artist-to-fan relationship, the clean album page template, and the honest 'pay what you want' economic stance. We want StageOne to feel similarly artist-centered.
- **Songkick** (songkick.com) — The gigs page is the template for our Gigs page: a clear, date-grouped list with venue and city, and a 'near me' filter. We borrow the grouping pattern.
- **Linktree** (linktr.ee) — Not a design reference but an economic one. Linktree proved that artists will adopt a centralized profile page if the activation cost is low. StageOne's artist-onboarding flow is tuned to feel just as quick.

- **Stripe docs** (stripe.com/docs) — The cleanest embodiment of a 'calm' design language — generous whitespace, a restrained color palette, and type-driven hierarchy. StageOne's color comps borrow this stance.

7.2 Sites we don't like (or want to avoid emulating)

- **ReverbNation** — Cluttered, ad-heavy, and slow. We explicitly avoid flashing banner ads and auto-playing audio.
- **MySpace (the modern one)** — Demonstrates how a once-beloved brand can lose trust through aggressive registration walls. StageOne keeps the public browse experience genuinely public.
- **A typical local-newspaper gigs listing** — Table-based, walls of text, no filtering. Useful as a reminder of the baseline we need to beat.
- **Most AI chatbots bolted onto otherwise-static sites** — The chat widget floats in the corner and is useless. StageOne's AI assistant is treated as a first-class feature with its own page, not a popover.

8. Competitors

The competitive landscape is divided into (a) broad streaming platforms that incidentally carry indie catalogs, (b) indie-focused artist platforms, and (c) gig-listing platforms. StageOne's design goal is to sit at the intersection of all three — more local than Bandcamp, more discoverable than Linktree, more artist-aware than Songkick.

Competitor	Type	What we can borrow	Where we differentiate
Spotify	Streaming	Scale, recommendation polish.	Hyper-local bias; first-class gig listings; no algorithmic suppression of small artists.
Bandcamp	Artist platform	Artist-first ethos; clean album page.	Discovery-by-geography; integrated AI discovery; gig listings.
Linktree	Artist bio link	Frictionless signup.	Music-native (audio player, gigs); richer profile.
Songkick	Gig listings	Date-grouped gig UX; 'near me' filter.	Coverage of small-venue/local-only gigs; integrated artist profile.
ReverbNation	Indie platform	(Cautionary.)	Clean interface, no ads, no pay-to-play.

Competitor	Type	What we can borrow	Where we differentiate
Local Facebook/IG pages	Social	Nothing.	A single place to find music + gigs; no algorithmic fade-out of posts.

9. Budget

The client has disclosed that there is zero cash budget available for this engagement. This subsection is therefore brief and points to the detailed Release Plan (Section 10 and 11) for dollar-level breakdowns.

- **Developer labor** — \$0.00 cash out-of-pocket to the client. Commercial-equivalent: \$31,620.00 at a blended \$85/hr rate.
- **One-time implementation non-labor** — \$151.99 commercial / \$0.00 to client.
- **First-year operating cost** — \$25.99 actual / \$4,247.99 commercial-equivalent on paid tiers.

9.1 Phased budget if the client later takes the site paid

If the client chooses to keep StageOne online beyond the capstone showcase, the recommended phased budget is:

1. Year 1 free tiers (through Apr 30, 2027): \$25.99 (domain renewal + minimal OpenAI usage).
2. Year 2 graduated upgrade if traffic grows: add Render Starter (\$7/mo) and Atlas M2 (\$9/mo) → total year-2 cost approximately \$217.99.
3. Year 3+ full paid tier per Release Plan Section 11.1: approximately \$4,247.99 annually.

9.2 Hosting and email fees

There is no separate 'hosting' or 'email' line item in year 1; every service in the stack is on its free tier. The two truly unavoidable annual costs are the domain renewal (\$13.99) and a nominal OpenAI-usage spend (~\$12).

10. Timescales

The project has a hard deadline: the WEB 268 capstone showcase happens at the end of the 15-week academic window, which runs from Monday, January 19, 2026 through Monday, May 4, 2026. The full week-by-week schedule appears in Release Plan Section 6; this section summarizes the top-level milestones.

Milestone	Due	Deliverable
Needs assessment signed off	Jan 22, 2026	StageOne_needs_assessment_questionnaire v1.0
Draft specification signed off	Feb 3, 2026	This document
Release v0.1 (skeleton)	Feb 4, 2026	Hello-world full-stack app in Dev
Release v0.2 (auth)	Feb 25, 2026	Login/registration live on Staging
Release v0.3 (content)	Mar 22, 2026	Tracks + gigs + follows live on Staging
Release v1.0-rc (release candidate)	Apr 20, 2026	Feature-complete build for UAT
UAT + pre-launch checklist	Apr 20–30, 2026	Crestodina checklist 100% green
Production cutover	May 1, 2026	www.stageone.app live
Hypercare + handover	May 1–4, 2026	Credentials transferred; Section 12 signed

The 15-week window is tight but not unreasonable. Per the original template guidance, web projects of this size typically run six weeks to six months. The scope has been locked specifically so the 15-week envelope holds.

10.1 Short-term solution

Because there is no existing StageOne site, there is no 'sign-up for early access' interim solution required. Launch on April 30 is the first time StageOne exists publicly.

11. Procurement Process

11.1 Point of contact

During the capstone the point of contact on the client side is the WEB 268 instructor, Eric Yoxheimer (ecyoxhei@hacc.edu, 717-780-1128). On the developer side, the point of contact is Eva Cihak (eqc34019@hawkmill.hacc.edu, 717-654-5756). All formal communications are to be routed by email.

11.2 Response deadlines

- **Draft spec review** — Client feedback requested within 3 business days of delivery (by end of Wed, Jan 22, 2026).
- **Weekly release review** — Client feedback requested within 48 hours of the Friday demo, so changes can land in the following week's sprint.
- **UAT defect triage** — Client feedback requested within 24 hours of the UAT kickoff on Apr 20, 2026, given the tight Phase 5 schedule.
- **Go/no-go decision** — Final sign-off required at Apr 30, 2026 4:00 p.m. ET meeting.

Appendix A. Site Map

Reproduced at full size for client review. The production site map will be maintained alongside the code in /docs/sitemap.png.

Figure A.1 — Provisional site map for StageOne (full-size).

Appendix B. Wireframes

Four low-fidelity wireframes cover the public-facing primary page types and the authenticated artist dashboard. These are intentionally un-styled — they communicate structure and content hierarchy, not visual finish.

B.1 Home / Landing

The home page leads with a single featured artist hero, followed by a horizontally scrolling 'new tracks this week' strip, a 'gigs near you' panel, and an always-visible CTA to register. The navigation is kept to five primary links plus an Account entry point.

Figure B.1 — Home / Landing wireframe.

B.2 Discover

Discover places filter controls (genre, city, sort) along the top of the page and displays results in a responsive card grid. The AI-assistant entry point is pinned to the top of the filter bar rather than hidden inside a popover.

Figure B.2 — Discover wireframe.

B.3 Artist page

The artist page is the workhorse of the site. The top third is a press-kit band: photo, name, city, genre chips, follow button. The middle third is the audio player and track list. The bottom third is upcoming gigs with a ticket link per row. A collapsed 'press kit' section at the bottom exposes high-resolution photos and a one-paragraph bio for press use.

Figure B.3 — Artist page wireframe.

B.4 Artist dashboard

The artist dashboard is the authenticated, role-gated counterpart to the public artist page. Four side-nav sections (My Profile, My Tracks, My Gigs, Messages) give the artist direct write-access to every field that appears on their public page, plus a simple analytics summary (followers, plays).

Appendix C. Color Comps

The StageOne color language is deliberately restrained.

C.1 Core palette

Token	Hex	Use
--navy (primary)	#1F3A5F	Headlines, top nav, primary buttons, links.
--amber (accent)	#E8A33D	Featured labels, role-gated surfaces, hover state.
--cream (background)	#F6F1E7	Page background, card interiors.
--ink (body text)	#1B1B1E	All long-form copy; 14.3:1 on cream.
--muted (secondary text)	#6B7280	Meta copy, timestamps, footers.
--light (borders)	#E5E7EB	Card borders, form dividers.

C.2 Typography

C.3 Contrast verification

The following color pairings have been verified to meet the WCAG 2.1 AA minimum contrast ratio (4.5:1 for normal text, 3:1 for large text):

- Ink on Cream — 14.36 : 1 (passes AAA)
- White on Navy — 10.36 : 1 (passes AAA)
- Ink on Amber — 7.44 : 1 (passes AAA)
- Muted on Cream — 4.68 : 1 (passes AA)

12. Sign-Off

By signing below, the parties acknowledge that the project specification defined in this document – including the objectives (*Section 2*), audiences (*Section 3*), site structure (*Section 4* and *Appendix A*), user stories (*Section 5*), non-functional requirements (*Section 6*), budget (*Section 9*), timescales (*Section 10*), procurement (*Section 11*), wireframes (*Appendix B*) and color comps (*Appendix C*) – is mutually understood and accepted. The release plan delivered in parallel governs the time and cost commitments derived from this specification.
